Beam experiment at ILL

At ILL/Grenoble reactor in 89-91 by Heidelberg-ILL-Padova-Pavia Collaboration

M. Baldo-Ceolin et al., Z. Phys., C63 (1994) 409

No GeV background!

No candidates observed.

Measured limit for a year of running:

$$\tau_{n\bar{n}} > 0.86 \times 10^8 \text{ s}$$

with $L \sim 76 \text{ m}$ and $\langle t \rangle = 0.109 \text{ sec}$

measured $P_{n\bar{n}} < 1.606 \times 10^{-18}$

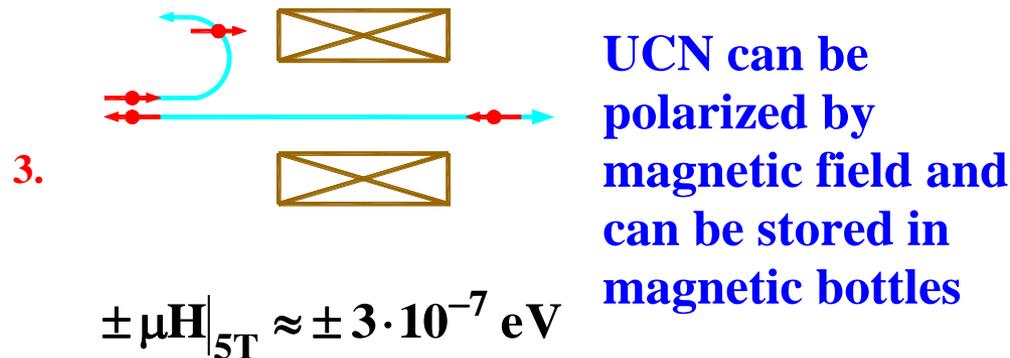

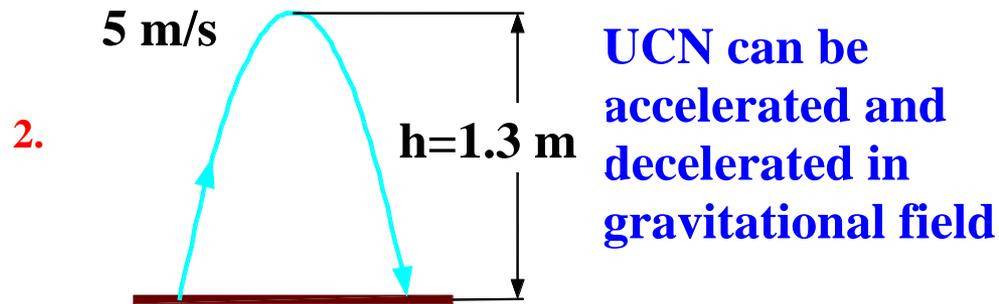

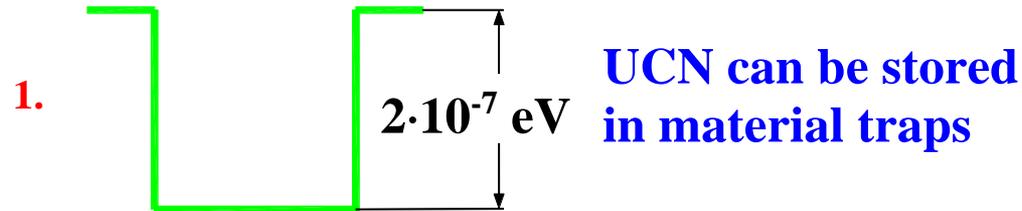

sensitivity: $N \cdot t^2 = 1.5 \times 10^9 \text{ s}^2/\text{s}$

\doteq "ILL sensitivity unit"

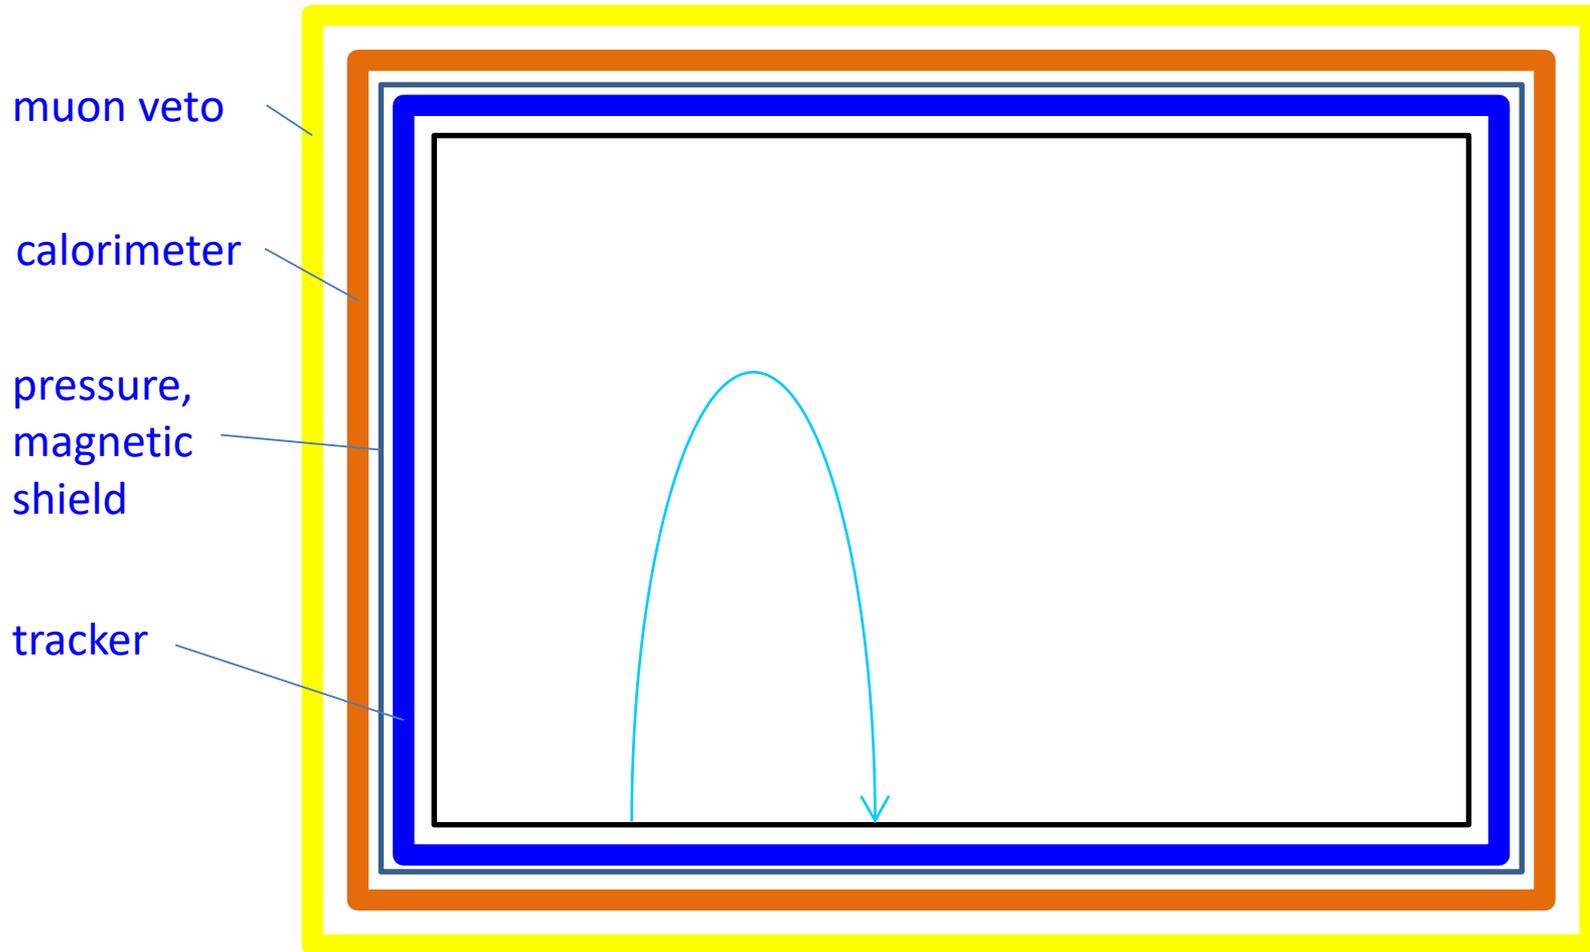

Ultracold neutrons

$\lambda \approx 800 \text{ \AA}$, $v \approx 5 \text{ m/s}$, $T \approx 1.5 \cdot 10^{-3} \text{ K}$, $E \approx 1.3 \cdot 10^{-7} \text{ eV}$

Firs observation of UCN in 1968.

What is the probability for UCÑ to be reflected?

$$\tilde{R} = \left| \frac{k_1 - k_2}{k_1 + k_2} \right|^2 \quad k_1^2 = \frac{2m\tilde{E}_\perp}{\hbar^2} \quad k_2^2 = \frac{2m}{\hbar^2} (\tilde{E}_\perp - \tilde{U})$$

$$\tilde{U} = \tilde{U}_0 - i\tilde{W} \quad \tilde{\eta} = \frac{\tilde{W}}{\tilde{U}_0}$$

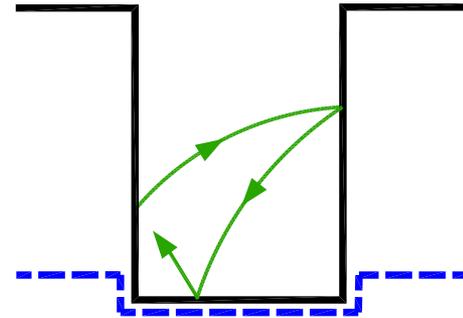

$$\tilde{R} = \left| \frac{1 - \sqrt{1 - \frac{\tilde{U}_0}{\tilde{E}_\perp} (1 - i\tilde{\eta})}}{1 + \sqrt{1 - \frac{\tilde{U}_0}{\tilde{E}_\perp} (1 - i\tilde{\eta})}} \right|^2$$

We can consider two cases:

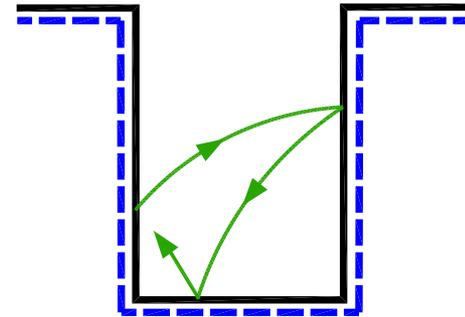

1. $\tilde{R} = 0$

(pessimistic case)

2. $\tilde{R} = \tilde{R} (\eta = 0.2) \approx 0.8$

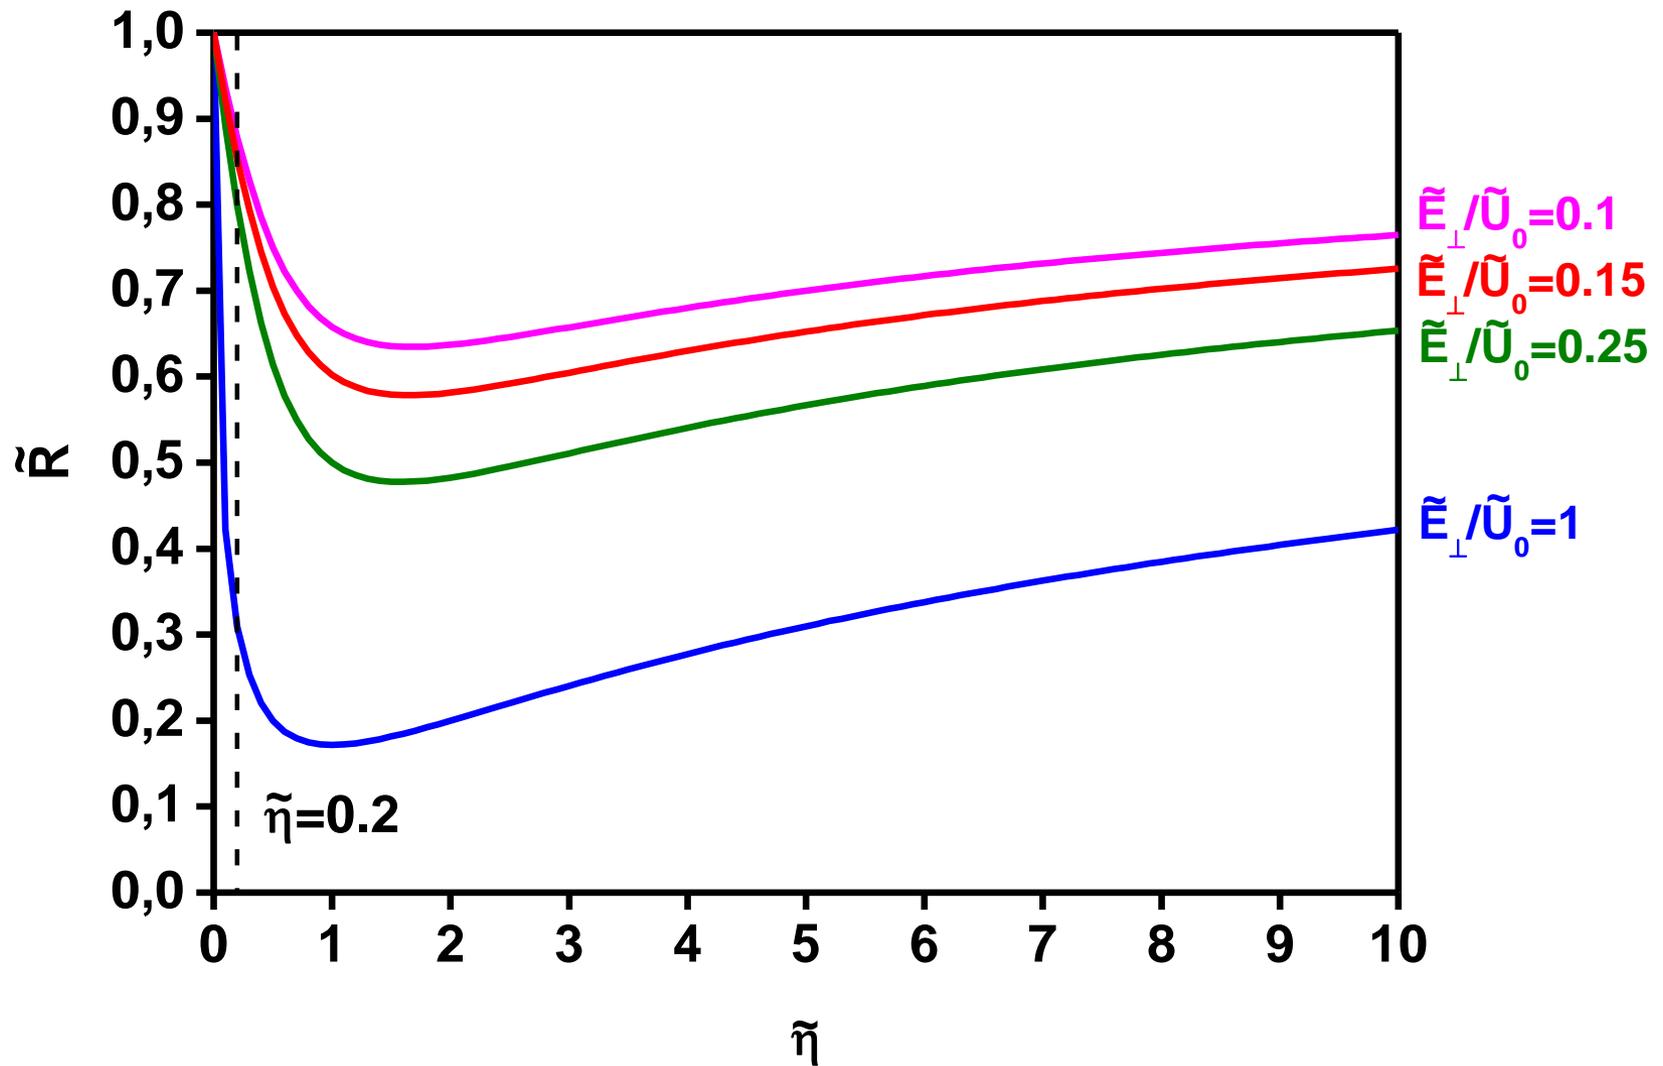

(optimistic case)

ESS	?	?	The possibility of NNbar with UCN should be considered.

Conclusion

1. Designed storage trap for NNbar oscillation experiment:
horizontal cylinder with diameter 2 m, length 4 m.
2. Increase of the experiment sensitivity is about 10 ÷ 40 times to ILL level at UCN source production 10^8 n/s.
3. Oscillation period for 3 years:
 $\tau_{n\bar{n}} \geq (0.6 \div 1.2) \cdot 10^9$ s (90% CL)
